Case Study 1: How Does a Bike-Share Navigate Speedy Success?

1. Introduction

Cyclistic is a bike sharing program that has a network of more than 5,800 bicycles and 600 docking stations all throughout the city of Chicago. They offer inclusive options such as cargo bikes, reclining bikes, and hand tricycles, making it accessible to people with disabilities. The majority of riders choose traditional bikes, with only about 8% using the assistive options. The program is popular for leisure rides, but around 30% of users also rely on it for daily commuting to work and school.

Cyclistic offers several pricing options, including single-ride passes, full-day passes, and annual memberships. Customers who purchase single-ride or full-day passes are considered casual riders, while customers who purchase annual memberships are considered members. Cyclistic aims to shift its marketing focus towards converting casual riders into annual members as they have proven to be more profitable. By analyzing historical bike trip data, the marketing team aims to understand the differences between annual members and casual riders, determine why casual riders would consider a membership, and explore the impact of digital media on marketing strategies.

2. Scenario

As a junior data analyst on Cyclistic's marketing analytics team, I have been tasked with analyzing historical bike-trip data to identify differences between casual riders and annual members. The director of marketing, Lily Moreno, believes that increasing the number of annual memberships will contribute to Cyclistic's future growth.

The results of this analysis will be used to identify patterns in how the two groups use Cyclistic bikes and support data-driven marketing recommendations. These recommendations will ultimately be presented to the Cyclistic executive team.

3. Data Analysis Process

This case study will follow the six steps of the data analysis process:

1. Ask
2. Prepare
3. Process
4. Analyze
5. Share
6. Act

Step 1: Ask

Business Task: Analyze Cyclistic's historical bike-trip data from the last 12 months (August 2025 through July 2026) to determine how annual members and casual riders use Cyclistic bikes differently. The insights gained from this analysis will help the marketing team develop strategies aimed at converting casual riders into annual members.

Three questions guide Cyclistic's future marketing program:

1. How do annual members and casual riders use Cyclistic bikes differently?
2. Why would casual riders buy Cyclistic annual memberships?
3. How can Cyclistic use digital media to influence casual riders to become members?

For this case study, I have been assigned to answer the first question:

How do annual members and casual riders use Cyclistic bikes differently?

The primary stakeholders for this analysis are Lily Moreno, the director of marketing; the Cyclistic marketing analytics team; and the Cyclistic executive team.

Step 2: Prepare

In this step, we will focus on identifying the data that will be used for the analysis, understanding how it is organized, and determining whether it is appropriate and credible for answering the business question.

Data Source: Cyclistic's historic trip data covering a 12-month period from August 2025 to July 2026. The data is publicly available under a data license referenced by the case study.

Data Organization: The dataset consists of 12 CSV files, with each file containing trip data for one month. The files follow the naming convention YYYYMM-divvy-tripdata, where the first four digits represent the year and the final two digits represent the month.

Each monthly file follows the same structure and contains the following 13 columns:

- ride_id — unique identifier associated with each ride
- rideable_type — type of bike used
- started_at — date and time the ride began
- ended_at — date and time the ride ended
- start_station_name — name of the starting station
- start_station_id — identifier of the starting station
- end_station_name — name of the ending station
- end_station_id — identifier of the ending station
- start_lat — latitude of the ride's starting location
- start_lng — longitude of the ride's starting location
- end_lat — latitude of the ride's ending location
- end_lng — longitude of the ride's ending location
- member_casual — identifies the rider as either an annual member or a casual rider

Step 3: Process

During the Process phase, the data will be combined, explored, cleaned, and transformed to prepare it for analysis. This process will include checking for missing or duplicate values, verifying data types, identifying invalid or inconsistent records, and creating additional fields that will be useful for analyzing differences between casual riders and annual members.

Tool: DuckDB was selected as the database management system for processing and analyzing the data using SQL. DBeaver was used as the graphical database management tool for connecting to the DuckDB database, writing SQL queries, and viewing query results.

Data Combination: The 12 monthly CSV files covering August 2025 through July 2026 were combined into a single table named `all_tripdata`. Because each monthly file follows the same structure, DuckDB was used to read all CSV files from the data directory and combine their records into one table.

The following SQL query was used to create the combined table:

```
CREATE TABLE all_tripdata AS
SELECT *
FROM read_csv_auto(
    'C:/Users/leebu/Downloads/CaseStudy1_cyclistic_bikeshare/data/*.csv',
    union_by_name = true
);
```

The `union_by_name = true` option was used to match the columns across the monthly files by column name when combining the data.

After creating the combined table, the following query was used to verify the total number of records:

```
SELECT COUNT(*) AS total_records
FROM all_tripdata;
```

This returned **6,037,968 records** representing bike trips recorded during the 12-month period from August 2025 through July 2026.

Data Exploration:

After combining the 12 monthly files, the `all_tripdata` table was explored to identify potential data-quality issues before cleaning and transforming the data.

The following query was used to verify the structure and data types of the combined table:

```
DESCRIBE all_tripdata;
```

The table contains 13 columns. DuckDB identified started_at and ended_at as TIMESTAMP values, the latitude and longitude fields as DOUBLE values, and the remaining fields as VARCHAR values.

Missing Values

The dataset was checked for missing values using the following query:

```
SELECT
  COUNT(*) - COUNT(ride_id) AS ride_id_nulls,
  COUNT(*) - COUNT(rideable_type) AS rideable_type_nulls,
  COUNT(*) - COUNT(started_at) AS started_at_nulls,
  COUNT(*) - COUNT(ended_at) AS ended_at_nulls,
  COUNT(*) - COUNT(start_station_name) AS start_station_name_nulls,
  COUNT(*) - COUNT(start_station_id) AS start_station_id_nulls,
  COUNT(*) - COUNT(end_station_name) AS end_station_name_nulls,
  COUNT(*) - COUNT(end_station_id) AS end_station_id_nulls,
  COUNT(*) - COUNT(start_lat) AS start_lat_nulls,
  COUNT(*) - COUNT(start_lng) AS start_lng_nulls,
  COUNT(*) - COUNT(end_lat) AS end_lat_nulls,
  COUNT(*) - COUNT(end_lng) AS end_lng_nulls,
  COUNT(*) - COUNT(member_casual) AS member_casual_nulls
FROM all_tripdata;
```

The results identified the following missing values:

- start_station_name: 1,273,200
- start_station_id: 1,273,200
- end_station_name: 1,336,777
- end_station_id: 1,336,777
- end_lat: 5,436
- end_lng: 5,436

No missing values were found in ride_id, rideable_type, started_at, ended_at, start_lat, start_lng, or member_casual.

Because station information is not required for every part of the analysis, records with missing station information will not automatically be removed from the entire dataset. These records can still provide useful information about ride duration, bike type, time of day, day of week, month, and membership type. Records requiring station information can be filtered separately when conducting station-specific analyses.

Duplicate Ride IDs

The following query was used to compare the total number of records with the number of unique ride IDs:

```
SELECT
  COUNT(*) AS total_records,
  COUNT(DISTINCT ride_id) AS unique_ride_ids,
  COUNT(*) - COUNT(DISTINCT ride_id) AS duplicate_ride_ids
FROM all_tripdata;
```

The combined dataset contains 6,037,968 records and 6,037,933 unique ride IDs, indicating that 35 duplicate ride IDs are present. These duplicate records will be investigated further before deciding how they should be handled during data cleaning.

Membership and Bike Types

The member_casual column was examined to verify the rider categories present in the dataset:

```
SELECT
  member_casual,
  COUNT(*) AS total_rides
FROM all_tripdata
GROUP BY member_casual
ORDER BY total_rides DESC;
```

The dataset contains two rider classifications:

- Member: 3,886,915 rides
- Casual: 2,151,053 rides

The rideable_type column was also examined:

```
SELECT
  rideable_type,
  COUNT(*) AS total_rides
FROM all_tripdata
GROUP BY rideable_type
ORDER BY total_rides DESC;
```

Two bike types were identified:

- Electric bike: 4,146,731 rides
- Classic bike: 1,891,237 rides

No unexpected categories were identified in either member_casual or rideable_type.

Data Cleaning:

After exploring the combined dataset, several data-quality issues were identified and addressed before beginning the analysis.

Duplicate Records

The dataset contained 35 exact duplicate records. Each duplicate was verified by comparing all 13 fields in the dataset. During the cleaning process, duplicate records were removed while retaining one instance of each unique ride.

Ride Duration

Ride duration was calculated using the difference between the `started_at` and `ended_at` timestamps. Initial exploration identified several abnormal ride durations. There were 29 rides with negative durations, 160,315 positive rides lasting less than one minute, and 5,341 rides lasting 24 hours or longer.

For this analysis, rides were considered valid if they lasted at least one minute but less than 24 hours. Records outside this range were excluded to reduce the effect of invalid or unusually extreme trips on the analysis.

Missing Values

A large number of records were missing start or end station information. However, these records were not removed from the cleaned dataset because station information is not necessary for analyzing ride duration, membership type, bike type, day of week, month, or time of day.

If station-specific analysis is performed later, records without the required station information will be excluded only from those analyses.

Creation of the Cleaned Dataset

A new table named `all_tripdata_clean` was created so that the original `all_tripdata` table remained unchanged. In addition to applying the cleaning rules, several calculated fields were created to support the analysis:

- `ride_length_minutes` — duration of each ride in minutes
- `day_of_week` — day on which the ride began
- `month` — month in which the ride began
- `start_hour` — hour of day in which the ride began

The following SQL query was used:

```
CREATE TABLE all_tripdata_clean AS
```

```
WITH deduplicated AS (  
  SELECT DISTINCT *  
  FROM all_tripdata  
)  
SELECT  
  ride_id,  
  rideable_type,  
  started_at,  
  ended_at,  
  ROUND(  
    (ended_at - started_at) / 60,  
    2
```

```

DATE_DIFF('second', started_at, ended_at) / 60.0,
2
) AS ride_length_minutes,
DAYNAME(started_at) AS day_of_week,
MONTHNAME(started_at) AS month,
EXTRACT(HOUR FROM started_at) AS start_hour,
start_station_name,
start_station_id,
end_station_name,
end_station_id,
start_lat,
start_lng,
end_lat,
end_lng,
member_casual
FROM deduplicated
WHERE DATE_DIFF('second', started_at, ended_at) >= 60
AND DATE_DIFF('second', started_at, ended_at) < 86400;
The cleaned dataset was then validated using:
SELECT COUNT(*) AS cleaned_records
FROM all_tripdata_clean;

```

The final cleaned table contains 5,872,255 records, compared with 6,037,968 records in the original combined dataset.

Step 4: Analysis

During the Analyze phase, SQL was used to examine the cleaned dataset and identify patterns in how annual members and casual riders use Cyclistic bikes differently. The analysis focused on overall ride activity, ride duration, day of week, monthly and seasonal trends, time of day, and bike type.

Overall Rider Usage

```

SELECT
  member_casual,
  COUNT(*) AS total_rides,
  ROUND(
    COUNT(*) * 100.0 / SUM(COUNT(*)) OVER (),
    2
  ) AS percent_of_rides,
  ROUND(AVG(ride_length_minutes), 2) AS avg_ride_minutes,
  ROUND(MEDIAN(ride_length_minutes), 2) AS median_ride_minutes
FROM all_tripdata_clean
GROUP BY member_casual
ORDER BY total_rides DESC;

```

Rider Type	Total Rides	% of Rides	Avg. Ride	Median Ride
Member	3,803,135	64.76%	12.26 min	8.75 min
Casual	2,069,120	35.24%	18.93 min	11.48 min

Annual members accounted for 64.76% of all rides, compared to 35.24% for casual riders. Although members completed substantially more rides, casual riders tended to take longer trips.

The average and median both support this pattern, indicating that members use the service more frequently overall while casual riders generally take longer individual trips.

Usage by Day of Week

```
SELECT
    day_of_week,
    member_casual,
    COUNT(*) AS total_rides,
    ROUND(AVG(ride_length_minutes), 2) AS avg_ride_minutes
FROM all_tripdata_clean
GROUP BY day_of_week, member_casual
ORDER BY
    CASE day_of_week
        WHEN 'Monday' THEN 1
        WHEN 'Tuesday' THEN 2
        WHEN 'Wednesday' THEN 3
        WHEN 'Thursday' THEN 4
        WHEN 'Friday' THEN 5
        WHEN 'Saturday' THEN 6
        WHEN 'Sunday' THEN 7
    END,
    member_casual;
WITH daily_rides AS (
    SELECT
        day_of_week,
        member_casual,
        COUNT(*) AS total_rides
    FROM all_tripdata_clean
    GROUP BY day_of_week, member_casual
)
SELECT
    day_of_week,
    member_casual,
    total_rides,
    ROUND(
        total_rides * 100.0 /
        SUM(total_rides) OVER (PARTITION BY member_casual),
        2
    ) AS percent_of_rider_type
FROM daily_rides
ORDER BY
    CASE day_of_week
        WHEN 'Monday' THEN 1
        WHEN 'Tuesday' THEN 2
        WHEN 'Wednesday' THEN 3
        WHEN 'Thursday' THEN 4
        WHEN 'Friday' THEN 5
        WHEN 'Saturday' THEN 6
        WHEN 'Sunday' THEN 7
    END,
    member_casual;
```

Member usage was more concentrated during the workweek. Wednesday accounted for 16.04% of member rides and Thursday for 15.94%. Casual riders showed a different pattern: Saturday was their busiest day with 438,723 rides (21.20%), followed by Sunday at 16.55%.

Overall, 37.75% of casual rides occurred on weekends, compared with 23.38% of member rides.

Casual riders also had longer average ride durations on every day of the week. On Saturday, casual rides averaged 21.54 minutes versus 13.53 minutes for members; on Sunday, casual rides averaged 22.06 minutes versus 13.45 minutes for members.

Monthly and Seasonal Trends

```
SELECT
    month,
    member_casual,
    COUNT(*) AS total_rides,
    ROUND(AVG(ride_length_minutes), 2) AS avg_ride_minutes
FROM all_tripdata_clean
GROUP BY month, member_casual
ORDER BY
    CASE month
        WHEN 'January' THEN 1
        WHEN 'February' THEN 2
        WHEN 'March' THEN 3
        WHEN 'April' THEN 4
        WHEN 'May' THEN 5
        WHEN 'June' THEN 6
        WHEN 'July' THEN 7
        WHEN 'August' THEN 8
        WHEN 'September' THEN 9
        WHEN 'October' THEN 10
        WHEN 'November' THEN 11
        WHEN 'December' THEN 12
    END,
    member_casual;
WITH monthly_rides AS (
    SELECT
        month,
        member_casual,
        COUNT(*) AS total_rides
    FROM all_tripdata_clean
    GROUP BY month, member_casual
)
SELECT
    month,
    member_casual,
    total_rides,
    ROUND(
        total_rides * 100.0 /
        SUM(total_rides) OVER (PARTITION BY member_casual,
        2
        ) AS percent_of_rider_type
    FROM monthly_rides
ORDER BY
    CASE month
        WHEN 'January' THEN 1
        WHEN 'February' THEN 2
        WHEN 'March' THEN 3
        WHEN 'April' THEN 4
        WHEN 'May' THEN 5
```

```

        WHEN 'June' THEN 6
        WHEN 'July' THEN 7
        WHEN 'August' THEN 8
        WHEN 'September' THEN 9
        WHEN 'October' THEN 10
        WHEN 'November' THEN 11
        WHEN 'December' THEN 12
    END,
    member_casual;

```

Both groups showed seasonal changes, with ridership increasing during warmer months and decreasing during winter. The pattern was considerably stronger among casual riders. July was the busiest casual month with 345,581 rides, followed by August with 323,566 and June with 297,273. Together, June, July, and August accounted for approximately 46.71% of all casual rides.

Member activity was more evenly distributed throughout the year. July was also the busiest month for members with 500,465 rides, representing 13.16% of annual member rides. Casual activity fell sharply in winter: January represented only 1.15% of casual rides and December 1.31%.

Usage by Time of Day

```

SELECT
    start_hour,
    member_casual,
    COUNT(*) AS total_rides
FROM all_tripdata_clean
GROUP BY start_hour, member_casual
ORDER BY start_hour, member_casual;

WITH hourly_rides AS (
    SELECT
        start_hour,
        member_casual,
        COUNT(*) AS total_rides
    FROM all_tripdata_clean
    GROUP BY start_hour, member_casual
)
SELECT
    start_hour,
    member_casual,
    total_rides,
    ROUND(
        total_rides * 100.0 /
        SUM(total_rides) OVER (PARTITION BY member_casual),
        2
    ) AS percent_of_rider_type
FROM hourly_rides
ORDER BY start_hour, member_casual;

SELECT
    start_hour,
    member_casual,
    COUNT(*) AS weekday_rides
FROM all_tripdata_clean
WHERE day_of_week IN (
    'Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday'
)

```

```
GROUP BY start_hour, member_casual
ORDER BY start_hour, member_casual;
```

Member activity showed noticeable morning and late-afternoon peaks. Across all days, members recorded 277,782 rides beginning at 8:00 AM and reached their highest hourly total at 5:00 PM with 409,967 rides. On weekdays, the pattern was even clearer: 247,949 member rides began at 8:00 AM and 345,325 began at 5:00 PM.

Casual activity generally increased throughout the day rather than showing the same pronounced morning peak, reaching its highest overall level at 5:00 PM with 195,881 rides. Combined with the weekday concentration of member rides, the member morning and afternoon peaks are consistent with routine transportation, including possible commuting. Because the dataset does not contain trip-purpose information, commuting cannot be directly confirmed.

Bike Type Usage

```
SELECT
  member_casual,
  rideable_type,
  COUNT(*) AS total_rides,
  ROUND(
    COUNT(*) * 100.0 /
    SUM(COUNT(*)) OVER (PARTITION BY member_casual),
    2
  ) AS percent_of_rider_type
FROM all_tripdata_clean
GROUP BY member_casual, rideable_type
ORDER BY member_casual, total_rides DESC;
```

Rider Type	Bike Type	Total Rides	Percentage
Casual	Electric bike	1,461,154	70.62%
Casual	Classic bike	607,966	29.38%
Member	Electric bike	2,525,229	66.40%
Member	Classic bike	1,277,906	33.60%

Electric bikes were the most commonly used bike type for both groups. Electric bikes accounted for 70.62% of casual rides and 66.40% of member rides. Both groups therefore showed a strong preference for electric bikes, although the preference was somewhat stronger among casual riders.

Key Findings

- Members ride more frequently. Annual members accounted for 64.76% of all rides, while casual riders accounted for 35.24%.
- Casual riders take longer trips. Casual rides averaged 18.93 minutes, compared with 12.26 minutes for members.
- Casual riders are more weekend-oriented. Approximately 37.75% of casual rides occurred on weekends, compared to 23.38% of member rides.
- Casual ridership is more seasonal. Approximately 46.71% of casual rides occurred during June, July, and August, while member activity was more evenly distributed throughout the year.

- Members demonstrate stronger weekday morning and afternoon peaks. Member activity peaks around 8:00 AM and 5:00 PM on weekdays, a pattern consistent with work and school commuting.
- Both groups prefer electric bikes. Electric bikes accounted for 70.62% of casual rides and 66.40% of member rides.

Overall, annual members appear to use Cyclistic more frequently and consistently, particularly during weekdays and common commuting hours. Casual riders take longer rides and demonstrate stronger weekend and seasonal patterns, suggesting that casual usage may be more closely associated with leisure and recreational activity.

Step 5: Share

In the Share phase, the results of the analysis were visualized using Tableau Public to clearly communicate the differences between casual riders and annual members. Five visualizations were created to compare overall ridership, average ride duration, day-of-week patterns, monthly trends, and weekday usage by hour of day. These visualizations were combined into a single dashboard to highlight the most important patterns identified during the analysis.

Tableau Dashboard

Cyclistic Bike-Share: Member vs. Casual Rider Behavior

August 2025 – July 2026 | 5.87 Million Rides Analyzed

Rider Type
casual member

Share of Total Rides By Rider Type

Average Ride Duration by Rider Type

Rides by Day of Week and Rider Type

Monthly Rides by Rider Type

Weekday Rides by Hour of Day

Figure 1. Cyclistic Bike-Share: Member vs. Casual Rider Behavior dashboard.

The dashboard summarizes the major differences between annual members and casual riders during the August 2025 through July 2026 analysis period. The individual visualizations below provide a closer look at these differences.

Overall Rider Usage

Annual members accounted for the majority of Cyclistic trips in the cleaned dataset. Members completed 3,803,135 rides, representing 64.76% of all trips, while casual riders completed 2,069,120 rides, representing 35.24%.

Share of Total Rides By Rider Type

Figure 2. Share of Total Rides by Rider Type.

Although casual riders completed fewer trips overall, their individual rides tended to last longer. Casual riders had an average ride duration of 18.93 minutes, compared with 12.26 minutes for annual members.

Figure 3. Average Ride Duration by Rider Type.

These results show that annual members use Cyclistic more frequently, while casual riders tend to take longer individual trips.

Rides by Day of Week

The distribution of rides throughout the week also showed clear differences between the two rider groups. Member rides were more heavily concentrated during weekdays, particularly Tuesday through Thursday. Casual ridership, however, increased substantially toward the weekend.

Rides by Day of Week and Rider Type

Figure 4. Percentage of each rider type's rides by day of week.

Saturday was the most popular day for casual riders, accounting for 21.20% of casual trips, followed by Sunday at 16.55%. In comparison, Saturday represented only 12.70% of member trips and Sunday represented 10.68%.

This pattern suggests that casual riders are more likely to use Cyclistic on weekends, while annual members demonstrate more consistent weekday usage.

Monthly Ridership Trends

Both annual members and casual riders demonstrated strong seasonal patterns. Ridership decreased substantially during the winter months before increasing throughout the spring and summer.

Figure 5. Monthly Rides by Rider Type from August 2025 through July 2026.

July recorded the highest ridership for both groups, with 500,465 member rides and 345,581 casual rides. January was particularly low for casual riders, with only 23,880 rides, compared with 109,878 member rides.

The larger seasonal variation among casual riders suggests that their use of Cyclistic may be more strongly associated with warmer months.

Weekday Rides by Hour of Day

Analyzing rides by starting hour revealed one of the clearest behavioral differences between the two groups. On weekdays, annual members demonstrated two distinct periods of high activity: a morning peak around 8:00 AM and a larger afternoon peak around 5:00 PM.

Figure 6. Weekday Rides by Hour of Day and Rider Type.

Member ridership reached approximately 247,949 rides at 8:00 AM and 345,325 rides at 5:00 PM on weekdays. Casual riders displayed a less pronounced morning peak and generally increased in activity throughout the afternoon.

This suggests that members use Cyclistic to commute to and from a routine weekday transportation such as work or school.

Key Findings

Here is a summary of the key differences between casual riders and annual members:

Casual Riders

Casual riders take fewer trips overall but tend to take longer rides than annual members. They account for 35.24% of total rides, with an average ride duration of 18.93 minutes, compared with 12.26 minutes for members.

Casual riders also show stronger weekend and seasonal usage patterns. Saturday is their most popular day, accounting for 21.20% of casual rides, and their ridership increases considerably during the warmer months, reaching its highest level in July. These patterns suggest that casual riders may use Cyclistic more for recreational or leisure travel.

Annual Members

Annual members use Cyclistic more frequently, accounting for 64.76% of all rides, but their trips are shorter on average at 12.26 minutes. Their rides are more concentrated during the weekdays, particularly Tuesday through Thursday.

On weekdays, member ridership also shows clear peaks around 8:00 AM and 5:00 PM, which correspond with typical commuting hours. This suggests that members may be more likely to use Cyclistic as part of their regular transportation routine.

Overall, casual riders tend to take longer rides and ride more heavily on weekends and during warmer months, while annual members ride more frequently and show stronger weekday and commute-hour usage patterns.

Step 6: Act

The final step of the data analysis process is to use the findings from the analysis to recommend actions that can help Cyclistic achieve its business goal. Based on the differences identified between casual riders and annual members, the following recommendations could help Cyclistic encourage casual riders to purchase annual memberships.

1. Target Weekend Riders

Casual riders are most active on weekends, especially Saturdays. Cyclistic could use targeted digital advertisements and promotions to highlight the benefits of annual membership to frequent weekend riders.

2. Focus Marketing During Warmer Months

Casual ridership increases significantly during spring and summer. Cyclistic could increase membership promotions during these months when casual riders are most actively using the service.

3. Promote Cyclistic for Routine Transportation

Members show strong weekday usage around typical commuting hours. Cyclistic could market annual memberships as a convenient option for commuting, errands, and other regular weekday transportation.
